

# AQUATHOL® K

## Aquatic Herbicide For Weed Control

### *Responsible Approach to Aquatic Habitat Management*

**SELECTIVITY:** Submerged weeds such as Hydrilla, Milfoils, and Pondweeds can be removed without harming other aquatic species generally considered beneficial including Vallisneria, Chara, and Nitella.

**AQUATHOL® K** does not effect emerged plants. Emerged plants such as Spadderdock, Water Lilies, Pickerel Weeds, and Bulrushes, generally considered to be beneficial to aquatic habitats, are not harmed by applications of **AQUATHOL® K**

**SITE SPECIFIC:** **AQUATHOL® K** is a contact herbicide with relatively short residual, and does not move significantly from the treatment area. This allows site specific control where aquatic plants are managed.

**AQUATHOL® K** requires a relatively short residual contact time (12-48 hrs) for control of nuisance aquatic plants. Therefore, **AQUATHOL® K** is effective in still or moving water in canals, ponds and lakes.

**EFFECTIVE:** **AQUATHOL® K** provides excellent control of Nuisance Plants including Hydrilla, Milfoils, Coontail and Pondweeds. See the **AQUATHOL® K** label for a listing of weeds controlled.

**COMPATIBLE:** **AQUATHOL® K** is an Environmentally Compatible aquatic plant management tool for the removal of nuisance submerged aquatic plants. Management using **AQUATHOL® K** can restore the aquatic habitat to beneficial levels for fishing and other recreation.

**AQUATHOL® K** has been used for more than 35 years in the aquatic environment. With a relatively short half life (typically 1-3 days in the lake environment) **AQUATHOL® K** does not bioaccumulate in the hydrosol or the food chain and breaks down to carbon dioxide and naturally occurring compounds in the environment. **AQUATHOL® K** provides a Selective, Site Specific, Effective, and Environmentally Compatible aquatic plant management tool.

***As with any pesticide, always read and follow label instructions and precautions.***
